I support XM radio beyond their right to provide ANY information via CONUS and/or terrestrial repeater signals.

Furthermore, as a sole licensee to a frequency assignment, I believe that the satellite license holders should also have the right to use that frequency assignment to transmit local and unique information to those areas served by terrestrial transmissions within their national frequency assignment.

So-called local broadcasters have aggregated their individual frequency assignments with satellite-delivered programming that provides, in many cases, absolutely no local programming other than a station ID -- the broadcasters are the pot calling the kettle black.
